CDSE website

Project status: what is built, where it lives, why, and what is left

Centre for Disability Studies and Empowerment, NLU Jodhpur

Prepared from the build sessions to date. Repository: Babloobhai-Badmos/CDSE

1. At a glance

The CDSE site is a plain HTML/CSS/JavaScript website (no build step) rebuilt to match the look of the real nlujcdse.in, using the page snapshots you supplied, because this working environment cannot reach that domain. All eight public pages are built, mobile-optimised and pushed. A second, separate piece of work adds a database-backed blog with an audio version of each post (Supabase for data, Cloudflare R2 for audio files). That code is written and tested against a simulated backend, but it is not connected to any real account yet, so the live site still shows the built-in list of 16 posts.

Area	Status	In one line
Public site (8 pages)	**DONE**	Built, responsive, pushed to the main work branch.
Header, scroll pill and menu	**DONE UNCONFIRMED**	Fixed several times; you have not reported flutter since the last fix, but I could not watch it on a real phone.
Mobile layout	**DONE**	Header and menu rebuilt for phones; no sideways scrolling on any page (tested 320 to 430 px).
Blog database + post pages + audio player + editor	**BUILT TESTED**	Tested with a simulated Supabase. Waiting for your real accounts.
Audio generation function	**BUILT UNTESTED**	Written, but never run: needs Azure, R2 and Supabase credentials.
Google Forms	**TODO**	Four forms are embedded with placeholder IDs; the forms themselves still need creating.

2. Where everything is

Two Git branches hold the work. Nothing has been merged into a default branch and no pull request has been opened.

Branch	Contains	Why separate
claude/website-redesign-nlujcdse-135pqx	The finished public site: all pages, styles, header/menu, mobile work, home-page blog teaser (built-in post list).	The designated working branch for the redesign.
claude/blog-audio-supabase	Everything above, plus one extra commit: Supabase schema and seed, post page, audio player, editor page, audio function, setup guide.	You asked for the backend work on its own branch so it can be reviewed before it goes live.

File map

Path	What it is	Why it is there
index.html	Home: hero with three buttons, a 'From the Blog' teaser (latest 3 posts), pull-quote.	Matches the real home page; buttons and blog teaser were added at your request.
about.html	Who we are, what we do, stats strip, parallax image, leadership, photo gallery, milestones, call to action, closing quote.	Made more persuasive (your choice) while keeping the theme.
projects.html	All six projects, full-screen parallax image, tan overview band, Millennium Fellowship checklist.	Real project content from your snapshot, with images used throughout.
blogs.html	Three tiers: hero post, 'Latest' (3 cards), 'Archives' (compact grid).	Layout you specified from your reference image.
post.html	A single post with its audio player. (backend branch)	Posts with on-site text can have audio; others link out.
submit-blog.html	Submission guidelines, email route, Google Form embed.	Separate page, as you asked.
get-involved.html, report-issue.html, contact.html	Form pages (Google Form embeds) with short visitor-facing intros.	Placeholders for the forms you will create.
admin.html	Editor page: sign in, write/publish posts, generate audio. (backend branch)	Lets editors publish without touching code.
css/style.css	The single stylesheet: theme, header pill, mobile rules, blog, audio player, editor.	One file keeps the look consistent.
js/main.js	Header pill on scroll, mobile menu, text-size and high-contrast controls, footer year.	Shared by every page.
js/posts.js, blog-render.js	Post data source (built-in list, or Supabase when configured) and the blog/home renderers.	One place to change where posts come from.
js/audio-player.js, post-view.js, admin.js, config.js	Audio player, post page logic, editor logic, and the (blank) Supabase settings. (backend branch)	New backend features.
supabase/	Database schema, seed of the 16 posts, and the generate-audio function. (backend branch)	Everything the new Supabase project needs.
docs/	Google Forms setup, Apps Script template, Supabase + R2 setup guide, and this report.	Step-by-step instructions for the parts only you can do.
reference/	Your four original HTML snapshots of the real site.	The source for theme and content.

3. What was built, and why

Decisions you made

- **Static HTML/CSS/JS, accessibility first.** No framework or build step, so anyone can edit it and it is fast on any host. Skip link, landmarks, visible focus, text-size and high-contrast controls on every page.
- **Rebuilt from your real snapshots.** The live domain is blocked from this environment, so the home, About, Projects and Blog content and the theme (black header, cream background, Cardo and Inter fonts) come from the files you pushed.
- **Supabase deferred, then adopted.** First postponed, then chosen for blogs and storage (with a newer account you will connect yourself), with Cloudflare R2 for large files.
- **'Blog' became 'Blogs'** everywhere; page breadcrumbs were removed; blog titles are the links themselves.

Header, scroll pill and menu (the most iterated area)

- The black header turns into a small translucent glass 'pill' on scroll. Flutter was traced to three causes and fixed: the switch flickering at one scroll position, an animation that cannot be interpolated, and a graphics-layer quirk with blur on a sticky element.
- The menu is a plain three-bar icon. The extra items (Report an Issue, Get Involved, Contact) and the accessibility controls sit in it, in the order you asked for. An earlier bug that left the dropdown permanently open was a CSS selector problem and is fixed.
- **Mobile:** the long title was forcing every page 100 px wider than a phone. Now: one-row header with a two-line title, 44 px touch targets, a full-width glass pill, and a single flat menu card. The menu closes on link tap, outside tap, Escape or resize. Desktop was compared pixel by pixel before and after and is unchanged.

Page design

- Full-screen fixed-background image sections (the effect from your video) on About and Projects. An earlier 'sticky' version was removed because it was not what you showed.
- About page: two-column 'Who we are' with the image beside both intro paragraphs; stats strip; gallery; milestones; closing call to action; quote moved to the bottom.
- Developer 'Setup needed' boxes on the form pages were replaced with visitor-facing text.

Blog and audio (backend branch)

- **Why audio:** to give blind and low-vision readers (and anyone who prefers listening) an audio version. Screen readers still matter most, so the post text stays properly structured; audio is an extra.
- **Database:** a posts table that anyone can read when published, and that only people on an 'editors' list can change, enforced by the database rather than the web page.
- **Player:** play/pause, back 15 s, forward 30 s, speed 0.75x to 2x, seek bar, remembers your place, phone lock-screen controls, download link, never autoplays. If a post has text but no MP3, the browser's read-aloud is offered instead.
- **Storage split:** text in Supabase; MP3 files in Cloudflare R2 (no charge for data leaving the bucket, so popular posts cannot use up a bandwidth limit).
- **Safe fallback:** if Supabase is not configured or fails, the site falls back to the built-in 16 posts, so it never shows an empty blog.

4. How the blog and audio backend fits together

Step	What happens	Where
1	An editor signs in at admin.html and writes or edits a post (plain text; blank line = new paragraph; '## ' = heading).	Supabase Auth + posts table
2	They press 'Generate audio'. The function checks the caller is an editor, splits the text into chunks, and sends each to the voice service.	Supabase Edge Function + Azure Speech
3	The joined MP3 is uploaded to the storage bucket and its public address is saved on the post.	Cloudflare R2
4	Visitors open post.html. It reads the post (and audio address) from Supabase and plays the file straight from R2.	Browser

Security notes: only the project URL and the public 'anon' key go in the website (js/config.js). The service-role key, Azure key and R2 keys are Supabase secrets and must never be pasted in the site or in chat. Post text is always displayed as plain text, never as HTML.

5. What is unfinished

The 'Who' column says whether the next step needs you (accounts, decisions, content) or can be done by me once you give the go-ahead or the details.

#	Task	Who	Why it is not done
1	Create the new Supabase project; run supabase/migrations and seed.sql; turn off public sign-ups; add yourself as an editor.	**YOU**	Needs your new account. I was told not to use the connected one, and did not.
2	Put the project URL and anon key in js/config.js.	**YOU** / **ME**	Paste them in chat and I will enter them; the anon key is safe to share.
3	Create the R2 bucket, a public custom domain, and an upload token.	**YOU**	Your Cloudflare account; the secrets must not be pasted in chat.
4	Create an Azure Speech resource (or choose another voice provider) and set all function secrets; deploy the function.	**YOU**	Needs accounts and keys. Commands are in docs/supabase-r2-setup.md.
5	Test the audio function end to end with one short post, then a long one (the free plan has a time limit of roughly 2.5 minutes per call).	**YOU** / **ME**	Never run: I had no credentials and no Deno runtime here.
6	Create the four Google Forms (contact, membership, accessibility report, blog submission) and replace the FORM_ID placeholders.	**YOU**	Field lists are in docs/google-forms-setup.md; optional email automation in docs/apps-script-template.gs.
7	Decide on, and obtain permission for, bringing archive posts onto the site (paste their text so they can have audio).	**YOU**	The 16 archive posts currently link out to nlujcdse.in; republishing needs the authors' consent.
8	Choose AI voice, human narration, or both; decide whether to label AI audio on the page.	**YOU**	A policy choice. Review each file for legal terms and Indian names.
9	Merge the two branches into your main branch (or open a pull request).	**YOU** / **ME**	Not requested yet.
10	Check facts that came from search snippets rather than your snapshots: milestone dates, the stats strip, leadership beyond Dr. Rashmi Mathur.	**YOU**	I could not read the live site; please verify before launch.
11	Confirm the scroll pill no longer flutters, on a real phone and a real desktop.	**YOU**	I could only test in a simulated browser.
12	Run an accessibility check (axe or Lighthouse) and a screen-reader pass (NVDA or VoiceOver).	**YOU** / **ME**	Not run. Needs a real screen reader for a proper result.

Recommended order

Items 1 to 4 first (accounts), then 2 and 5 (connect and test), then 6 (forms), then 7 and 8 (content decisions), then 11 and 12 (checks), then 9 (merge).

6. Suggestions not yet built

These came from the review I gave you. None has been started; tell me which you want.

Idea	Why it would help
Copy images into your own storage (R2) instead of loading them from nlujcdse.in	Today every photo and the logo loads from the old site. If it changes or goes down, this site loses its images. Highest-value fix.
Make the header title a plain link instead of a top-level heading	Each page currently has two top-level headings, which hurts screen readers and search.
Share one header and footer across pages (small script or Eleventy)	They are copy-pasted into every page; any nav change means editing all of them.

Idea	Why it would help
Move inline styles into named CSS classes	Makes the design easier to change consistently.
Share-preview tags, favicon set, a proper 404 page, an accessibility statement page	Better links on WhatsApp/LinkedIn; stronger credibility for a disability centre.
Animated stats counter, back-to-top button, blog search once there are 30+ posts	Polish; low priority.
Podcast-style RSS feed for the audio	Lets people follow the blog in any podcast app; cheap once audio exists.
Host the site on Cloudflare Pages	One dashboard for site, audio and images; plan redirects from old URLs.

7. Risks and things to know

- **Supabase free projects pause** after about a week without activity, which would take the blog offline. Visit regularly, add a scheduled ping, or keep the built-in fallback (it is already there).
- **Free-tier limits** (storage, bandwidth, voice-service allowance) are quoted from memory. Check each provider's current page before relying on them.
- **Hot-linked images** mean broken pictures if the old site changes. My screenshots show blank images for this reason; it is not a layout fault.
- **Not yet on a real device:** everything was tested in a simulated Chromium browser. Please try the scroll pill, the menu and the audio player on a real phone.
- **The audio function is untested**, and AI voices can mispronounce legal terms and names, so someone should listen to each file.

8. Running it locally

From the repository folder:

```
python3 -m http.server 8765
then open http://localhost:8765/index.html
```

Before Supabase is connected, the editor page shows a message instead of a login. The public pages work as normal.
